## **Principles of Invasive Hemodynamics**

Taking a simple blood pressure with a cuff is a hemodynamic measurement. By taking a blood pressure, you can determine three hemodynamic parameters. The systolic pressure, the diastolic pressure, and, using these two numbers, you can calculate the mean pressure. Hemodynamic monitoring can be much more involved than a simple blood pressure reading. It may involve actual measurements of pressures directly within the heart.

CVP can be measured in Cm of H<sub>2</sub>O (older method, uses a manometer attached to a stopcock) and mm Hg (uses a computer). Hemodynamics and States of Shock. Again, this system uses a pressure tubing that sends a signal through the transducer to a monitor which displays a waveform and reading.

By using invasive hemodynamic monitoring the nurse is able to evaluate the patient's immediate response to treatment such as drugs and mechanical support. The nurse can evaluate the effectiveness of cardiovascular function such as cardiac output, and cardiac index.

## **Hemodynamics Basic Concepts - SlideShare**

Hemodynamic monitoring is a central component of intensive care. Patterns of hemodynamic variables often suggest cardiogenic, hypovolemic, obstructive, or distributive (septic) etiologies to cardiovascular insufficiency, thus defining the specific treatments required. Monitoring increases in invasiveness, as required, as the risk for cardiovascular instability-induced morbidity increases because of the need to define more accurately the diagnosis and monitor the response to therapy.
