From a forensic point of view, it is of interest that gravid blow fly females are much more attracted by stages of initial decay, while non-gravid flies were much more present during advanced decay . Different ages affect the behavior of blow flies, e.g. as non-gravids required a protein food for egg maturation, while gravid specimens required protein food for egg deposition.

Blow flies, part of a large family of flies, is known for the larvae and immature flies infesting animal carcasses. Adult blow flies feed primarily on flower nectar, plant sap, and other sugary materials. The female blowfly typically lays its eggs on the body of a recently killed animal.

Get Rid of Blow Flies - Do-It-Yourself Pest Control

Blow flies are heavily attracted to dead carrion and other dead things. This is because the larvae of Blow flies burrow into and feed on the dead remains. Blow fly larvae need a lot of protein to develop and this is why dead meat is the preferred breeding ground. After 3 weeks to a month the Blow flies larvae will be fully grown.

Cluster or attic flies are the genus *Pollenia* in the blowfly family Calliphoridae. Unlike more familiar blow flies, such as the bluebottle genus *Phormia*, they do not present a health hazard because they do not lay eggs in human food. Cluster fly larvae develop inside earthworms living in the ground outside of homes.
